

## Seminar Summer Term 2024 How to give a good presentation

Katharina Eggensperger

KEggensperger katharina.eggensperger@uni-tuebingen.de AutoML for Science

April 30th, 2024

Some parts of this presentation are adapted from a <u>seminar</u> hold by André Biedenkapp, with permission.

## [5min] Final topic/date assignment

[?] Your questions regarding the organization [30min] **How to give a good presentation** [?] Your Questions

[45min] AutoML for/with pre-trained models

 $\rightarrow$  You'll have to give a lot of presentations in your life (in academia **and** industry)

Such presentations can decide whether

- You get a job
- You get a promotion
- Your favourite project gets funded
- You get the resources you need
- ...
- You get a good grade ;-)

Photo by Matthew Jungling on Unsplash

- 1. Structure is key
- 2. Adapt your talk to your audience
- 3. Present in pictures
- 4. Readable slides
- 5. Descriptive Titles (new)
- 6. Practice, Practice, Practice!
- 7. Check your technical equipment before
- 8. Behave naturally
- 9. Learn from the mistakes of others

achine learning

#### High level to low level to high level

- Catch your audience's attention
- Then tell them what you'll tell them and why they should care (priming)
- Then tell it to them
- Then tell them what you just told them

## Make transitions clear, don't forget the "meta-talk"

- Example: "In order to explain X, first I'll need to explain Y" or "Now that we've seen X and Y, we have the ingredients to do Z"
- Use a recurring slide to remind your audience where you are

## Don't get lost in details

- In case of doubt leave out some details
- Use a "T-structure": combine broad coverage of a topic with depth about one aspect
- Focus on what **you** find most interesting

 have backup slides with left out details / experiments / methods

#### Start your presentation with

- a brief introduction of yourself
- a motivation of why your topic matters and why the audience should care
- what you will talk about (outline slide only for >30 mins)

## End your presentation with

- the main takeaways
- a lookout
- a clear statement announcing the end of your presentation, e.g. *That's it from my side and now I am happy to answer questions*
- a Thank-you slide is not necessary, better show the conclusion/discussion slide (unless you thank collaborators)

#### The paper you are presenting is written for a specialized research community.

#### In general

- A talk to the CEO is completely different than one to the tech support group
- A talk applying method Y to domain X is completely different when you're talking to community X or Y

#### Consider the background of your audience

- "Customize" the motivation
- Cover the necessary background
- We are experts on some topics don't bore us with what we already know

## 🕇 Bonus tips

- Connect your talk with the other talk in your slot, e.g. using the same method / addressing the same problem
- Connect your talk to the overall topic of the seminar

#### **Example structure**

1.

introduction high-level

main part high-level

outro high-level

- motivation [2min]
  - $\rightarrow$  why is this needed? what is the limitation of previous work?
  - $\rightarrow$  connect to other work (also in this seminar)?
- 2. contributions [2min]  $\rightarrow$  what is novel? how does the paper add value to the field?
- 3. method [8min]  $\rightarrow$  how does it work?
- 4. results [5min]  $\rightarrow$  how well does it work?
- 5. strengths / limitation of the approach [2min]
  →when does it fail, is there a bottleneck, problems in practice, weak empirical evaluation
  →how is it better than previous work, when does it work well?
- 6. conclusion [1min]
  - $\rightarrow$  main take home message

#### Slides full of text are hard to follow

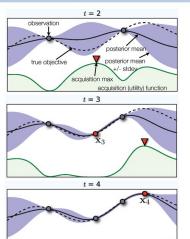

- The audience will read and not listen to you
- Reduce text, use more images
- Use animation only to guide focus of attention

#### Method of Choice: Bayesian Optimization

- Prominent approach to optimize expensive blackbox functions [Mockus et al., '78]
- Approach
  - Observe a few function evaluations
  - Construct a probabilistic model of the objective function, for example a Gaussian process
  - Use that model to compute a so-called acquisition function that quantifies how useful a new data point is, trading off exploitation of areas predicted to be good and exploration of areas where the model is uncertain
  - Use the acquisition function to select the next point to evaluate the function at
  - Evaluate the function there, refit the model, and iterate
- · Efficient in the number of function evaluations
- · Works when objective is nonconvex, noisy, has unknown derivatives, etc
- Recent convergence results [Srinivas et al, '10; Bull '11; de Freitas, Smola, Zoghi, '12]

#### Method of Choice: Bayesian Optimization

- Prominent approach to optimize expensive blackbox functions [Mockus et al., '78]
- Efficient in the number of function evaluations
- Works when objective is nonconvex, noisy, has unknown derivatives, etc
- Recent convergence results [Srinivas et al, '10; Bull '11; de Freitas, Smola, Zoghi, '12]

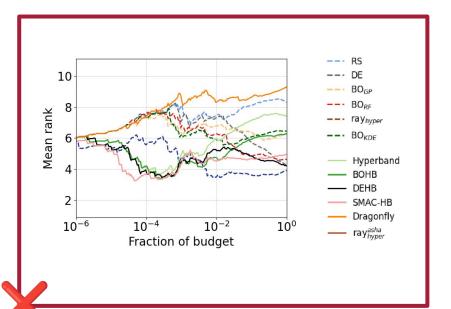

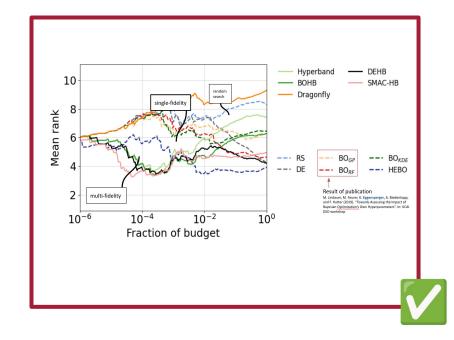

#### How to present a graph/plot?

- always explain what the graph shows
- use presenter to guide audience
- take enough time

# $\rightarrow$ The same applies to equations and tables

#### Text, Font & Color

#### pick a reasonable text and background color

- 2. Can you read this? Also from the back? Remember, the contrast and resolution of your laptop is usually much better than that of the projector
- 4. Pick a single font type and color and use it throughout *the whole presentation*
- 5. Highlight important **keywords** when there is a lot of text, but: choose a <u>consistent *way*</u> of highlighting

## Graphics

- 1. Size up figures to use most of the slide.
- 2. Not all animations are useful.
- 3. Screenshots are okay, if you do not have access to the original image.

#### Other

- 1. Meke sure tere are no typos in yur slides
- 2. A list needs more than one entry
  - e.g. this is not a list!
- 3. Make sure slides are self-contained (important for most presentation types)

The title of your slide should be **informative**, e.g.

- a. Motivation
- b. Method
- c. Experiment / Results
- d. Future Work

- a. LLMs can support data scientists
- b. The right prompt matters
- c. Experiments on a Kaggle dataset
- d. Next up: Automatically win Kaggle competition

## 🕇 Bonus tips

Before you start creating the first slide:

- Write down the main messages (~20 short sentences = one slide per minute)
- Create slides to support the content of each sentence

#### 1. Plan each part!

- Have a time budget
- Have bullet points with the main points
- Practice & check the timing for the part

#### 2. Put it all together and practice!

- Do the transitions work?
- Always get stuck at the same point? Change that point!
- Don't speak too fast! Speaking too slowly is almost impossible
- Make use of breaks

#### 3. Finetune start and beginning!

- Know how you want to start (when you're most nervous)
- Know how you want to end (what the audience remembers)

## 👆 Bonus tips

- Practice starting at a random slide of your presentation
- Stand and use presentation mode (as realistic as possible)

#### Checklist

- Do you have to bring your own laptop?
  - Does your laptop work with the projector?
  - Do you have the right dongle?
  - Internet connection switched off?
  - Desktop free of too personal items?
  - Screen saver switched off?
  - Enough battery or laptop plugged in?
- Is your presentation in the right format?
- Do all videos show properly?
- Does audio work?
- (if applicable) Does your laser pointer work?

WWW. PHDCOMICS. COM

- Prepare and test your equipment before the talk!
- Have your slides also as a PDF/offline version ready

Keep eye contact with the audience; don't turn your back

 $\rightarrow$  But do <u>not</u> wonder what they might think of your presentation! (now it's too late)

#### **Relax!**

#### This also applies to answering questions:

- Listen to the whole question carefully; don't interrupt
- Repeat what you understood, especially for long/multiple questions.
- Think before you answer (!)
- Answers should be short and precise.
- If you don't know the answer, say so. This is okay.

## 👆 Bonus tips:

- Ask someone to take a video of you presenting and watch it
- Think about potential questions (and practice answering them)

#### Have you ever been to a presentation where you were

♂, ≥, ☺ or irritated by a specific behaviour of the presenter?

## Then

- Analyze what went wrong
- (if possible) give them (friendly & constructive) feedback
- Do not make the same mistakes

#### 🔶 Bonus tip

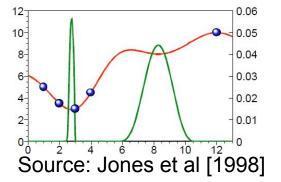

• If you see a great presentation, learn from it (and let the presenter know that you enjoyed the presentation)

#### 1. Never present other people's work as your own

- Never copy-paste (even critical if it is your own work)
- State explicitly what is your contribution
- 2. Give appropriate credit
  - references for figures
  - licence for photos/icons
  - Quotes: X and Y [12] define this problem as follows : "..."

 $\rightarrow$  Never cheat or plagiarize on purpose, clearly mark your references, adopt best practices for avoiding mistakes

#### Slides will be taken into account for your grade

#### $\rightarrow$ Send me your slides (as pdf) within two days (!) after your presentation.

Note: If you change anything (fixed equations, corrected typo, add explanation) in the slides, please add a short statement in the email.

During Q&A? (this part of your presentation)

- first part: clarification questions (answer them to the best of your knowledge)
- Have some ideas for topics to discuss with the audience ready
  - What did you like about this paper?
  - How does this relate/improve/extend other papers?
  - How does this fit into the context of AutoML?
  - What are the weaknesses of this approach?
  - What would you improve/look at if you would work on this?
  - Would you have an application for this method?
  - Is there code available?
  - etc.

If you're not the presenter, also think about these questions when reading the paper (participating in the discussione is also part of your grade)

After each presentation: Anonymous feedback survey. Not part of your grade. If you don't want feedback, let me know.

#### What?

- everyone can/should provide <u>constructive (!)</u> feedback to everyone
- feedback regarding content, slides and style

#### How?

- I will provide you with a link and ask you to add a QR code as your last slide
- I will give you access to the survey (or send you results)
